

Takes production incidents end-to-end

Noisy alerts and tickets become structured investigations — hypotheses tested, root cause found across every domain, remediation under your guardrails, recovery verified. A role, not a person: always-on, estate-wide, no personal inbox.

- Detect
- Diagnose
- Remediate
- Verify

FROM RAW SIGNAL TO ONE INVESTIGATION

THE INCIDENT LIFECYCLE

01

Detect

Group the noise

Dedupe alerts, tickets and requests into one investigation.

02

Investigate

Test hypotheses

Against logs, metrics, traces and prior incidents.

03

Diagnose

Root cause

Causal chain across domains, with a confidence score.

04

Remediate

Apply the fix

Roll back, revert, scale or restart — under guardrails.

05

Verify

Confirm recovery

Re-check firing signals, hold a stability window.

06

Learn

Update the model

Folds into service map, runbooks and knowledge.

GOVERNED AUTONOMY — THE CONTROL LAYER

Autonomy management
Set how far the orchestrator may act alone — per service, action class and environment.

Continuous monitoring
Estate-wide watch with pre-alert investigation before a page is raised.

AI-driven remediation
Decisions become governed actions through the tools you already run.

Execution guardrails
Hard boundaries on what may run, where and when. Nothing outside the lines.

Approvals & handoffs
Consequential actions gate on a human; routine fixes hand to coding agents.

Learning & auditability
Every run logged, gated and attributed — folded back into the model.

WORKS WITH YOUR STACK — 50+ INTEGRATIONS

OBSERVABILITY

Datadog · Prometheus · Grafana · CloudWatch · Splunk

INCIDENT
